05 – Floating Point Numbers

CS1022 – Introduction to Computing II

Dr Jonathan Dukes / jdukes@scss.tcd.ie
School of Computer Science and Statistics

Binary Number Representation

2

32-bits ... 2^{32} unique values that we can use to represent different things

e.g. unsigned integers

0 ... $2^{32}-1$ or

0 ... 4,294,967,295

e.g. signed integers using 2's complement

-2^{31} ... 0 ... $+2^{31}-1$

-2,147,483,648 ... 0 ... +2,147,483,647

How do we represent real numbers like 3.14 or $2\frac{1}{2}$?

How do we represent values with really large or really small magnitudes?

e.g. 2.2×10^{11}

e.g. 1.3×10^{-8}

Useful to think first about normalised decimal scientific notation

Binary Floating-Point Numbers

3

Convert the following binary numbers to decimal numbers with fractions

10010101

1.1

101000.01

Convert the following decimal numbers to binary floating point numbers

$10\frac{1}{2}$

$5\frac{1}{4}$

7.75

2.1

IEEE 754 Floating-Point Representation

4

Use a different interpretation of a 32-bit value to represent floating point numbers, e.g. IEEE 754

$$(-1)^s \times f \times 2^e$$

How can we represent ...

... positive and negative values?

... values with positive and negative exponents?

Where is the radix point?

5

1 \Rightarrow negative floating-point number

Option 2: Biased exponents

Diagram illustrating the IEEE 754 single-precision floating-point format (32 bits):

- sign (s):** 1 bit (bit 31).
- exponent (e):** 8 bits (bits 30-23).
- fraction (f):** 23 bits (bits 22-0).

$$(-1)^s \times f \times 2^{e-b}$$

Problem: Multiple Representations

6

Assume that the radix point is immediately after the LSB

$$+1.11 \times 2^{(128 - 127)} = 1.11_2 = 1.75_{10}$$

$$+0.111 \ 2^{(129 - 127)} = 1.11_2 = 1.75_{10} \text{ (same value!)}$$

Don't want multiple representations of the same value! (*if* $(a == b) \dots$)

Store floating-point numbers in normalised form

1.ddd ... d

Normalisation

$$0.0101 \times 2^{-4}$$

... becomes ...

$$1.0100 \times 2^{-6}$$

adjust fraction so there is a single 1 to left of radix point

compensate by adjusting exponent accordingly

If there is always going to be a 1 to the left of the radix point, we don't need to store it!

Increases precision (by one bit) – like not storing the 2 LSBs of a branch target offset!

Final IEEE 754 Floating-Point Representation

8

$$(-1)^s \times 1.f \times 2^{(e-b)}$$

Examples?

Special Values

9

Special bit patterns, e.g.

Zero (\pm)

Infinity (\pm)

Not a Number (NaN)

Single and Double Precision

10

32-Bit Single Precision

64-Bit Double Precision

Intel to work on software patch for Pentium bug

Quick fix: Program will work around the flaw discovered 6 months ago

Grove says I'm sorry about Pentium bug

By DEAN TAKAHASHI
Mercury News Staff Writer

Andrew S. Grove, chief executive of Intel Corp., apologized Monday to the nation's scientists for a flaw in the company's flagship

Flawed Chip Bruises Intel

Investors react, stock plunges

Associated Press

New York
Intel Corp. stock dropped sharply yesterday after a minor flaw in the company's Pentium microprocessor triggered a rash of negative publicity for the world's largest chipmaker.

The problem, first months ago, received national attention Thursday after two weeks of discussion by researchers and mathematicians on the Internet, the global computer network, and some coverage in high-technology industry publications.

Reacting for the first time, investors sent Intel's stock down 2 percent, or 14, to 63 on the Nasdaq stock market, which was closed for Thanksgiving on Thursday.

But analysts dismissed the idea of a long-term problem for the Santa Clara company.

"Interesting, but irrelevant," said David Wu, an analyst with S.G. Warburg. "These things are quickly forgotten. People won't remember it by Monday."

The flaw occurred in early versions of the Pentium. Once every few billion calculations, the chip might produce a wrong answer to a complex division problem—one with at least nine digits to the right of the decimal point.

Analysts estimate about 2 mil-

Intel Knocked For Response On Flaw

By Jonathan Cassell

SAN MATEO, CALIF. — Amid criticism of how it has handled a flaw in an early version of its Pentium microprocessor, Intel Corp.'s problems mounted last week as reports surfaced that the bug could be worse than the company has claimed.

The division flaw occurs in normal spreadsheet calculations up to the third significant digit, according to a re-

port issued by Mark Edelman, an analyst with Prudential Securities Research, San Francisco. Intel has claimed the problem could appear in equations that have been calculated out to nine digits beyond the decimal point. Such instances arise only in obscure mathematical operations for scientific equations and should affect the average user once every 27,000 years, according to Intel.

But Edelman said the error is far more common than Intel claims. "We believe the

Intel's Grove Aims Apology for Pentium Over the Internet

But CEO, Defending Policy Not to Replace All Chips. Doesn't Silence Criticism

By DON CLARK
Staff Reporter of The Wall Street Journal

Intel Corp.'s chief executive officer, Andrew Grove, took to cyberspace to apolo-

of relief at such a minor issue, he said. An Intel spokesman said publicly about the bug last week had caused a sharp increase in calls to the company, with Intel technicians discussing the type of work users are doing and deciding if a new chip is appropriate. Mr. Grove asked computer users for patience, because it will take time to answer all of the calls.

"Please don't be concerned that the passing of time will deprive you of the opportunity to get your problem resolved—we will stand behind these chips for the life of the product," Mr. Grove wrote.

But electronic responses to Mr. Grove's message suggest that some computer users are still upset that Intel didn't immediately publicize the problem and halt all

calling Intel's toll-free number (800-628-8666), even if you're not an MIT professor. Intel doesn't make it easy. But in a test I conducted over the past week, I managed to get Intel to agree to send me a new Pentium even though I refused to tell Intel what I did for a living or what software I used. The company said I'd have it within 30 days. "If you insist on a new chip, we'll supply a new chip," Intel Senior Vice President Carl Everett

reliantly conceded in an interview before I called the toll number. But it isn't a consumer-friendly process. I had to go through multiple conversations (it took me three phone calls over six days). When I was asked if I wanted to talk to an expert or receive a "white paper" about the nature of the defect in the chip, I said no thank you, that I just wanted a new chip.

THE INTEL person then wanted to know what software I used. I replied that it was none of his business, and I wanted a new chip. I had to give Intel a credit-card number and agree to a potential charge of \$1,800 if I failed to return my old Pentium within 29 days after receiving my new one—an ironic requirement from a company that delayed for months even discussing the defect. Intel paid for shipping both the new chip to you and the old one back, but not for any labor costs you may incur in hiring somebody to swap the chips.
